PT PT	Nei	New cellulose synthase improving stalk quality	se synt talk gu	chase p ality	olyp or s	polypeptides and po y or silage, and in	polynucleotides n increasing co	les, useful in concentration of

N

The invention relates to isolated nucleic acids encoding two cellulose synthase proteins from corn, Cdpgs45 (cesA-3) and Cqrael9 (cesA-9).

Also disclosed are a recombinant expression cassette comprising the polynucleotide (operably linked to a promoter) a host cell comprising the recombinant expression cassette and a transgenic plant comprising the recombinant expression cassette and a transgenic plant comprising the recombinant expression cassette. The nucleic acid is useful in the improvement of stalk quality for improved stand or silage, and in the increased concentration of cellulose in the pericarp, hardening the kernel, and thus improving its handling ability. The nucleic acids may also be used as probes or amplification primers in the detection, quantification or isolation of gene transcripts, as probes in detecting deficiencies in the level of mRNA, for detecting gene mutations or alliants, for monitoring up regulation of expression or changes in enzyme activity in screening assays, for site directed mutagenesis, and in sense or antisense suppression of one or more genes in a host cell, tissue or plant. The polypeptides may be used in assays for or brayme agonists or antagonists, and as immunogen or antigen to obtain antibodies specifically immunoreactive with the protein. cellulose in the pericarp, hardening the kernel for improved handling Claim 3; Page 85-87; 88pp; English invention ability

New genes which encode maize cellulose synthase polypeptides in plants useful for modulating the expression of cellulose synthase in plants and to produce transgenic plants expressing the novel protein

Claim 15; Page 142-144; 119pp; English.

The present sequence represents a maize cellulose synthase polypeptide. The cellulose synthase can be used for the improvement of stalk quality for improved stand or silage. It also provides an increased concentration of cellulose in the pericarp, hardening the kernel and improving its handling ability. The sequences are used to produce transgenic plants and seeds expressing the cellulose synthase. The polynucleotide is

used for modulating, preferably increasing, the level of the synthase in a plant cell. The plants are preferably monocots. The polynucleotide is also used as a probe or primer in the detection quantitation or isolation of gene transcripts. The probes are useful in detecting deficiencies in the level of mRNA in screenings for desired transgenic plant, for detecting mutations in the gene, for monitoring upregulation of expression or changes in enzyme activity in screening assays of compounds, for detection of any number of allelic variants of the gene, or for use as mollecular markers in plant breeding programs. The isolated nucleic acids of the present invention can also be used for the present invention can also be used for the monocompounds. immunogens in the preparation and/or screening of antibodies. The proteins can be employed in assays for enzyme agonists or antagonists of enzyme function or for use of immunogens or antigens to obtain antibodies specifically immunoreactive with a protein.

The present sequence represents a maize cellulose synthase polypeptide.

The cellulose synthase can be used for the improvement of stalk quality
for improved stand or slage. It also provides an increased concentration
of cellulose in the pericarp, hardening the kernel and improving its
handling ability. The sequences are used to produce transgenic plants
and seeds expressing the cellulose synthase. The polynucleotide is
used for modulating, preferably increasing, the level of the synthase
in a plant cell. The plants are preferably monocots. The polynucleotide
is also used as a probe or primer in the detection quantitation or
isolation of gene transcripts. The probes are useful in detecting
deficiencies in the level of mRNA in screenings for desired transgenic
plant, for detecting mutations in the gene, for monitoring upregulation
of expression or changes in enzyme activity in screening assays of
compounds, for detection a markers in plant breeding programs. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       plants

This polypeptide is encoded by cDNA clone Ath-B (see AAV06567)
that was isolated from an Arabidopsis thaliana cDNA library using
pCR primers (see AAV06563-34) based on cellulose synthase RSW1
genomic clone 23H12 (see AAV06563) and EST clone AAT20782 (see
AAV06562). It is closely related to Arabidopsis cellulose synthase RSW1
cprotein (see AAW03561-17). Claimed nucleic acid molecules (see
AAV06562-69) codung for claimed polypeptides (see AAW33816-20 and
AAW46202) involved in cellulose biosynthesis can be used to
manipulate the cellulose and/or beta-glucan content of transgenic
plants. Expression of nucleic acids in the sense orientation
increases the level of cellulose and reduces the level of
non-crystalline beta-14-glucan and starch, providing plants with
corresponding to the content of a transgenic corresponding to the content of a transgenic plant, e.g. to improve digestibility or to
alter carbon partitioning such that increased carbon is available
correction content of a transgenic plant, e.g. to improve digestibility or to
alter carbon partitioning such that increased carbon is available
correction content of a transgenic plant, e.g. to improve digestibility or to

```
The present sequence represents a maize cellulose synthase polypeptide.

The cellulose synthase can be used for the improvement of stalk quality

of callulose in the perioarp, hardening the kernel and improving its

handility. The sequences are used to produce transgenic plants

and seeds expressing the cellulose synthase. The polynucleotide is

used for modulating, preferably increasing, the level of the synthase

in a plant cell. The plants are preferably monocots. The polynucleotide

is also used as a probe or primer in the detection quantitation or

isolation of gene transcripts. The probes are useful in detecting

deficiencies in the level of mRNA in screenings for desired transgenic

plant, for detecting mutations in the gene, for monitoring upregulation

of expression or changes in enzyme activity in screening assays of

compounds, for detection of any number of allelic variants of the gene,

compounds, for detection of any number of allelic variants of the

compounds, for detection of any number of allelic variants of the

compounds, for detection of any number of allelic variants of the

compounds, for detection of any number of allelic variants of the

compounds, for detection of any number of allelic variants of the

compounds, for detection of any number of allelic variants of the

compounds, for detection of any number of allelic variants of the

compounds the preparation and/or screening of antibodies. The

formunogens in the preparation and/or screening of antibodies. The

proteins of the preparation and/or screening of antibodies. The

proteins of the preparation and/or screening of antibodies. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a maize cellulose synthase polypeptide.

The cellulose synthase can be used for the improvement of stalk quality for improved stand or silege. It also provides an increased concentration of cellulose in the pericarp, hardening the kernel and improving its handling ability. The sequences are used to produce transgenic plants and seeds appreciating the cellulose synthase. The polynucleotide is used for modulating, preferably increasing, the level of the synthase of a plant cell. The plants are preferably monocots. The polynucleotide is used for modulating or primer in the detection quantitation or isolation of gene transcripts. The probes are useful in detecting deficiencies in the level of mRNN in screenings for desired transgenic collar market of monitoring upregulation of expression or changes in enzyme activity in screening assays of compounds, for detection of any number of allelic variants of the gene, continued the compounds in the plant breeding programs. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a maize cellulose synthase polypeptide.
The cellulose synthase can be used for the improvement of stalk quality
of cellulose stand or slage. It also provides an increased concentration
of cellulose in the pericarp, hardening the kernel and improving its
handling ability. The sequences are used to produce transgenic plants
and seeds expressing the cellulose synthase. The polynuclectide is
used for modulating, preferably increasing, the level of the synthase
in a plant cell. The plants are preferably monocots. The polynuclectide
is also used as a probe or primer in the detection quantitation or
isolation of gene transcripts. The probes are useful in detecting
deficiencies in the level of mRNA in screenings for desired transgenic
plant, for detecting mutations in the gene, for monitoring upregulation
of expression or changes in enzyme activity in screening assays of
compounds, for detection of any number of allelic variants of the gene,
compounds, for detection of any number of allelic variants of the gene,
compounds for detection of the present invention can also be used for
recombinant expression of the present invention can also be used so
immunorate in the present invention can also be used for
immunorate in the present in a proper level or for use as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a maize cellulose synthase polypeptide.

The cellulose synthase can be used for the improvement of stalk quality
for improved stand or silage. It also provides an increased concentration
of cellulose in the pericarp, hardening the kernel and improving its
nd seeds expressing the cellulose synthase. The polynucleotide is
used for modulating, preferably increasing, the level of the synthase
or used for modulating preferably monocots. The polynucleotide
is also used as a probe or primer in the detection quantitation or
solation of gene transcripts. The probes are useful in detecting
of esticiencies in the level of manA in screenings for desired transgenic
plant, for detecting mutations in the gene, for monitoring upregulation
of expression or changes in enzyme activity in screening assays of
compounds, for detection of any number of allelic variants of the gene,
or for use as molecular markers in plant breeding programs. The
confoundinant expression of the present invention can also be used for
tecombinant expression of the present invention can also be used sof imminioned the present invention and also the present invention and and the present invention and the present invention and the present invention and also be used sof imminioned the present invention of antibodies when
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  19;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New genes which encode maize cellulose synthase polypeptides in plants useful for modulating the expression of cellulose synthase in plants and to produce transgenic plants expressing the novel protein \, -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     immunogens in the preparation and/or screening of antibodies. The proteins can be employed in assays for enzyme agonists or antagonists of enzyme function or for use of immunogens or antigens to obtain antibodies specifically immunoreactive with a protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CLQCKTKYKRHRGSPAIRGEEGDDTDADD-GSDFNYPASGTEDQKQKIADRMRSWRMNTG 119

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                US-09-900-237-30

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                     DOMAIN: There are two conserved domains in the globular part of the protein: the N-terminal domain (domain A) contains the conserved DXD motif and is possibly involved in catalysis and substrate binding. The C-terminal domain (domain B) contains the QXXRW motif and is present only in processive glycosyl transferases. It could be involved in the processivity function of the enzyme, possibly required for holding the growing glycan chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 434

-!- DOMAIN: There are two conserved domains in the globular part of the catalytic subunit: the N-terminal domain (domain A) contains the conserved DXD motif and is possibly involved in catalysis and substrate binding. The C-terminal domain (domain B) contains the QXXRW motif and is present only in processive glycosyl transferases. It could be involved in the processivity function of the enzyme, possibly required for holding the growing glycan chain in the active site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Acetobacter xylinum.";
J. Bacteriol. 177:5276-5283(1995).
-!- CATALYTIC ACTIVITY: UDP-glucose + {(1,4-beta-D-glucosyl})(N) = UDP + {(1,4-beta-D-glucosyl)}(NN11).
-!- SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  EGDFAELYMFKWTTLLIPPTTILIINWYGVVAGTSYAINSGYQSWGPLFGKLFFAFWVIV 1023

                                                                                       DOMAIN: There are two conserved domains in the globular part of the protein: the N-terminal domain (domain A) contains the conserved DXD motif and is possibly involved in catalysis and substrate binding. The C-terminal domain (domain B) contains the OXXRW motif and is present only in processive glycosyl transferases. It could be involved in the processivity function of the enzyme, possibly required for holding the growing glycan chain the active site.
CATALYTIC ACTIVITY: UDP-glucose + {(1,4-beta-D-glucosyl)}(N) = UDP
                                  cyclic diguanylic acid

                                                                                                                                                                                                                                                                                                                                                                                                      DOMAIN: There are two conserved domains in the globular part of the protein: the N-terminal domain (domain A) contains the conserved DXD motif and is possibly involved in catalysis and substrate binding. The C-terminal domain (domain B) contains the OXXRW motif and is present only in processive glycosyl transferases. It could be involved in the processivity function of the enzyme, possibly required for holding the growing glycan chain in the active site.
                                                                                                                                                                                                                                                                        + {(1,4-beta-D-glucosyl)}(N+1).
COFACTOR: Magnesium (By similarity).
ENZYME REGULATION: Activated by bis-(3'-5') cyclic diguanylic acid
                                                                                                                                                                                                                                                      CATALYTIC ACTIVITY: UDP-glucose + {(1,4-beta-D-glucosyl})(N) = UDP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MISCELLANEOUS: The genes bscA, bcsB, bcsZ and bcsC are constitutively transcribed but cellulose synthesis occurs only when adrA, a putative transmembrane protein regulated by agfD, is expressed. Cellulose production is abolished in E.coli K12. SIMILARITY: BELONGS TO THE GLYCOSYLTRANSFERASE FAMILY 2. CAUTION: Ref. 1 sequence differs from that shown due to a frameshift in position 128.
                                                                                          PRICEORY Catalytic subbnit of cellulose synthase. It polymerizes uridine 5'-diphosphate glucose to cellulose, which is produced as an extracellular component for mechanical and chemical protection at the onset of the stationary phase, when the cells exhibit multicellular behavior (rdar morphotype). Co-expression of cellulose and thin aggregative fimbriae leads to a hydrophobic
                                                                                                                                                                                                                                                                                                                                  (c-di-GMP).
PATHWAY: Bacterial cellulose biosynthesis.
SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane

                                                                                                                                                                                                         (Potential).

DOMAIN: There are two conserved domains in the globular part of the protein: the N-terminal domain (domain A) contains the conserved DXD motif and is possibly involved in catalysis and substrate binding. The C-terminal domain (domain B) contains the QXXRW motif and is present only in processive glycosyl transferases. It could be involved in the processivity function of the enzyme, possibly required for holding the growing glycan chain in the active site.
                                                                   + {(1,4-beta-D-glucosyl)}(N+1).
COFACIOR: Magnesium (By similarity).
ENZYME REGULATION: Activated by bis-(3'-5') cyclic diguanylic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DPLKEPPIVTANTVLSILAVDYPVDKVSCYVSDDGASMLTFDALAETSEFARKWVPFVKK 422

"Phosphodiesterase Al. a regulator of cellulose synthesis in Acetobacter xylinum, is a heme-based sensor.";
Biochemistry 40:3420-3426(2001).
-! FOWGTION: Catalytic subunit of cellulose synthase. It polymerizes uridine 5'-diphosphate glucose to cellulose in a processive way. The thick cellulosic mats generated by this enzyme probably provide a specialized protective environment to the bacterium.
-! CATALYTIC ACTIVITY: UDP-glucose + {(1,4)-beta-D-glucosyl}(N) - UDP + {(1,4)-beta-D-glucosyl}(N+1).
-! COFACTOR: Magnesium.
-! EXECULATION: Activated by bis-(3'-5') cyclic diguanylic acid
                                                                                                                                                                                                                                                                             Cochectal).

DOMAIN: There are two conserved domains in the globular part of the catalytic subunit: the N-terminal domain (domain A) contains the conserved by motif and is possibly involved in catalysis and substrate binding. The C-terminal domain (domain B) contains the CXRW motif and is present only in processive glycosyl transferases. It could be involved in the processive glycosyl the enzyme, possibly required for holding the growing glycan chain in the active site.

INDUCTION: Callulose is produced at a linear rate with respect to cell growth when O(2) is present.

SIMILARITY: BELONGS TO THE GLYCOSYLTRANSFERASE FAMILY 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            330 -INRETY-LDRLALRYDREGEPSQLA------AVDIFVSTVDPLKEPPIVTANT 375

                                                                   DOMAIN: There are two conserved domains in the globular part of the catalytic subunit: the N-terminal domain (domain A) contains the conserved DXD motif and is possibly involved in catalysis and substrate binding. The C-terminal domain (domain B) contains the OXXRW motif and is present only in processive glycosyl transferases. It could be involved in the processivity function of the enzyme, possibly required for holding the growing glycan chain the active site.

Putative cellulose synthase 3 [Includes: Cellulose synthase
catalytic subunit [UDP-forming] (EC 2.4.1.12); Cyclic di-GMP binding
domain (Cellulose synthase 3 regulatory subunit)].
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (Potential).
-!- DOMAIN: There are two conserved domains in the globular part of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Umeda Y., Hirano A., Ishibashi M., Akiyama H., Onizuka T., Ikeuchi

the catalytic subunit: the N-terminal domain (domain A) contains the conserved DXD motif and is possibly involved in catalysis and substrate binding. The C-terminal domain (domain B) contains the OXXRW motif and is present only in processive glycosyl transferases. It could be involved in the processivity function of the enzyme, possibly required for holding the growing glycan chain in the active site.

SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE GLYCOSYLTRANSFERASE FAMILY 2.

SIMILARITY: IN THE C-TERMINAL SECTION; DELONGS TO THE ACSB/BCSB

-:- COFACTOR: Magnesium (By similarity).
-:- ENZYME REGULATION: Activated by bis-(3'-5') cyclic diguanylic acid (c-di-GMP) (By similarity).
-:- PATHWAY: Bacterial cellulose biosynthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FUNCTION: Catalytic subunit of cellulose synthase. It polymerizes uridine 5'-diphosphate glucose to cellulose, which is produced as an extracellular component for mechanical and chemical protection
                                                                                                                                                                                                                                                                                                 425 FLFAGONII------AAAPLAVAAYALPHMFHSIATAAKVNKGWR-YSFWSEVYE 472

the protein: the N-terminal domain (domain A) contains the conserved DXD motif and is possibly involved in catalysis and substrate binding. The C-terminal domain (domain B) contains the CXXRW motif and is present only in processive glycosyl transferases. It could be involved in the processivity function of the enzyme, possibly required for holding the growing glycan chain in the active site.	sierase; Glycosyltransferase; CATALYTIC SUBDOMAIN A.                                                                                                                                                                                                                                                                                                                          DOMAIN: There are two conserved domains in the globular part of the catalytic subunit: the N-terminal domain (domain A) contains the conserved DXD motif and is possibly involved in catalysis and substrate binding. The C-terminal domain (domain B) contains the OXXRW motif and is present only in processive glycosyl transferases. It could be involved in the processivity function of the enzyme, possibly required for holding the growing glycan chain in the active site.

INDUCTION: Cellulose is produced at a linear rate with respect to
                                                                                                                                                                                                                                                                                              Saxena I.M., Brown R.M. ENZYME REGULATION: Activated by bis-(3'-5') cyclic diguanylic acid (cd1-GMP) (By similarity).
PATHWAY: Bacterial cellulose biosynthesis.
SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DOMAIN: There are two conserved domains in the globular part of the catalytic subunit: the N-terminal domain (domain A) contains the conserved DXD motif and is possibly involved in catalysis and substrate binding. The C-terminal domain (domain B) contains the OXXW motif and is present only in processive glycosyl transferases. It could be involved in the processivity function of the enzyme, possibly required for holding the growing glycan chain
